**Tags of images:** There is only one tag used for adding images to our webpage. The tag is <img>. It is an empty tag which means it needs not to be closed. Out of many attributes, 'src' is used essentially with this tag since without 'src', <img> is of no use.

Syntax:

```
<img src = "images/file1.jpg">
```

The source of image

The attribute for source

The tag

NOTE: While writing 'src' to the <img> tag, it must be kept in mind that the path can be of two types- absolute and relative.

- Absolute path is given when the image is not in the same folder where the webpage is kept.
- Relative path is given when the image is in same folder where the webpage is kept.

Here in this image, the path is relative. Absolute paths start with the root directory like-
d:\abc\images\file1.jpg

Attributes:
- **height**   -   to specify the height of image (in pixels)
- **width**   -   to specify the width of image (in pixels)
  Syntax:

```
<img src = "images/file1.jpg" height = "240" width = "320">
```

- **border**   -   to specify the width of border (in pixels). A '0' means no border.
  Syntax:

```
<img src = "images/file1.jpg" border = "2">
```

- **title** - to specify a title for the image on mouse hover
  Syntax:

```
<img src = "images/file1.jpg" title = "The Taj Mahal">
```

- **alt** - to specify an alternate text when image is not loaded.
  Syntax:

```
<img src = "images/file1.jpg" alt = "The Taj Mahal">
```

Assignments:

1. Write the correct syntax for adding an image in a webpage.
2. What are the different attributes of <img> tag?
