Topic: **CSS – Height & Width (Part 11)**

Subject **Web Designing & Publishing (WDP)**
Date: **29-Apr-2020**

CSS – Height & Width

CSS height and width

The height and width properties are used to set the height and width of an element.

```
height: 100px;  
width: 100px;
```

The value of height and width can be given in percentage, pixels and using other CSS units.

We can also set the maximum height and width for an element using **max-height** and **max-width** property. These properties help browser to handle the element properly in small screen.

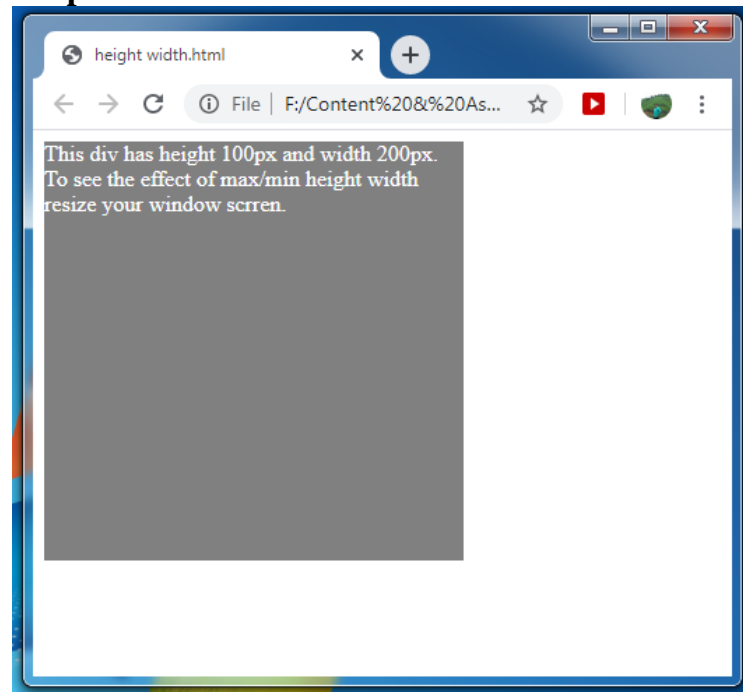

In similar way, **min-height** and **min-width** properties are used to set the minimum height and width of an element. These properties help browser to handle the element properly in big screen.

```
div {  
    height: 100px;  
    width: 200px;  
    max-width: 500px;  
    max-height: 500px;  
    min-width: 100px;  
    min-height: 100px;  
}
```

Example: Setting the height and width of <div> tag.

```
<html>
<head>
  <style>
  div{
    height: 300px;
    width:300px;
    max-width: 500px;
    max-height: 500px;
    min-width:100px;
    min-height:100px;
    background-color:grey;
    color:white;
  }
</style>
</head>
<body>
<div> This div has height 100px and width 200px. To see the effect of max/min height width resize
your window screen. </div>
</body>
</html>
```

Output:

Exercise:

1. Create a webpage that has two paragraphs and set the height and width of the first paragraph to 200px and 350px, second paragraph to 250px and 400px.
